

Wasp Baiting Pre-Treatment Checklist

GIPPSLAND
PEST MANAGEMENT

Description of Treatment

This treatment needs to be conducted over multiple site visits usually over a 2-3 week period. The initial site setup visit would involve setting up wasp baiting stations with lure in various locations around the site where activity is being experienced.

The technician would then need to attend the site every 2-3 days to check the wasp baiting stations and replenish them as required. It is essential that these stations remain replenished once the wasps have started feeding to get the best result from the program.

A Wasp baiting program will be effective within a 1 km range of the wasp baiting locations. The lure used in a wasp baiting program contains a smell that deters Bees or any other non-target pests from interacting with the lure. However, it is imperative that the wasp baiting stations and lure are removed at the completion of the wasp baiting program.

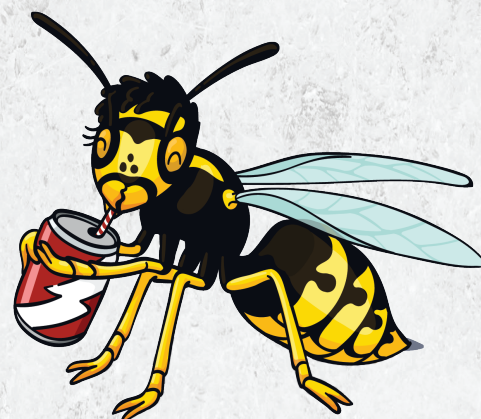

Thank you for choosing Gippsland Pest Management to complete a Wasp Baiting Program. To ensure you get the most from your Wasp Baiting Program, please ensure the following has been carried out:

1. Know where you are experiencing the most activity around your site.
2. Ensure pets and children are kept away from the wasp baiting areas whilst the program is in effect
3. In high activity areas, it will take 2-3 weeks before you are seeing a decline in the wasp activity around your site.

Payment Options

Payment for this program is due on the day of each site visit. We accept payments via Cash or Card
